ENTERGY LOUISIANA, LLC
LOUISIANA PUBLIC SERVICE COMMISSION
UNDOCKETED WINTER STORM EVENT

Response of: Entergy Louisiana, LLC
to the First Set of Data Requests
of Requesting Party: Louisiana Public Service Commission

Question No.: LPSC 1-9 Part No.: Addendum:

Question:

Could any of those outages been prevented with different preparation or enhanced vegetation maintenance prior to the Winter Storms?

a. If outages were caused by fallen or sagging tree limbs, could those outages have been prevented with better vegetation maintenance by your company?

b. Please provide all locations within your service area that were included within your vegetation maintenance schedule over the past two years (2019-2020) and the first 2 months of 2021.

c. Please provide the locations in your service area that received the most scheduled vegetation maintenance within the two years (2019-2020) and the first 2 months of 2021.

d. Please provide the locations in your service area that received the least scheduled vegetation maintenance within the past two years (2019-2020) and the first 2 months of 2021.

e. Please provide the locations with the most distribution grid damage due to fallen or sagging trees or tree limbs during the Winter Storms.

i. If possible, please explain how many customers lost power due to the vegetation damage in these locations?

Response:

The Company initially notes that it is not possible to answer the question as it seeks a speculative response about what "could" have occurred under an alternative set of facts and circumstances than what actually did occur during the Winter Storm events. There is no way for the Company, or any entity or individual, to know what could have happened during speculative scenarios. For this, and other reasons, utility regulation is not conducted from a hindsight, after-the-fact, perspective. Nonetheless, the Company has attempted to provide responsive information in the sub-sparts below.

a. Most of the vegetation-related outages (i.e., those "caused by fallen or sagging tree limbs") during the Winter Storms were caused by overhanging limbs outside of the Company's trimming specifications[1] and trees outside of the ROW ("OROW") and beyond the Company's normal maintenance boundaries being weighed down with ice to the point of failure. While potentially reducing vegetation-related outages, cyclic trimming of OROW vegetation is generally cost-prohibitive and management of OROW vegetation is typically limited to the removal of specific hazards identified in the course of other maintenance activities. The Company has however proposed to initiate a program to identify, track and eliminate OROW hazards on a pro-active basis using newly available technology to enhance the efficiency and cost-effectiveness of these efforts. That proposal is pending in Docket. No. U-35565.

With regard to transmission line maintenance, transmission vegetation maintenance is performed in conjunction with distribution vegetation maintenance. Additionally, transmission lines are inspected on an annual basis, and maintenance is assigned based on the conditions and priority of the vegetation identified during inspections. Inspections are a key component of the maintenance program and are used to identify and schedule needed work and, if conditions are identified during line inspections that identify additional work needed between scheduled maintenance activities, the resulting work is scheduled appropriately and completed based on the existing conditions of the ROW. The transmission lines that experienced a fallen limb event during the Winter Storms all received maintenance activities during the prior year and, but for OROW trimming, additional maintenance activities would not have prevented the outages.

b. See attached cycle plan for the distribution organization Jan 2019 – Feb 2021. All transmission facilities received cyclical maintenance during the referenced time period.

c. See attached list of distribution circuits trimmed on cycle maintenance from Jan 2019 – Feb 2021. All transmission facilities received cyclical maintenance during the referenced time period.

d. See attached list of distribution circuits not trimmed on cycle maintenance from Jan 2019 – Feb 2021. All transmission facilities received cyclical maintenance during the referenced time period.

e. It is important to note that areas with the most distribution grid damage, which is the information sought by this request, will not always correlate

[1] The Company's trimming specifications apply to overhanging limbs that are within a height of 20 feet above the Company's facilities. Overhanging limbs that are more than 20 feet above the Company's facilities are not within the trimming specifications and can only be addressed through Skyline Trimming. "Skyline Trimming" references the removal of all limbs on a tree from the ground to the sky with no overhanging limbs remaining. Such trimming is always done on the side of the tree that is facing the Company's conductors.

to the areas where most outages occurred. For example, impacts from a weather event in a rural area may affect several poles and line miles of conductor, but not affect very many customers due to sparse population. Similarly, a single piece of equipment that is damaged in a more densely populated urban area could cause several outages. Subject to that clarification, the Company notes that damage assessment data indicates that a total of 523 spans were damaged due to vegetation issues. The top three networks that had spans damaged by vegetation were Bastrop (70% of total vegetation damage, causing 409 outages, approximately 2% of the Winter Storm vegetation related outages), BR Metro (15% of total vegetation damage, causing 4,422 outages, approximately 24% of the Winter Storm vegetation related outages) and West Monroe (8% of total vegetation damage, causing 2,144 outages, approximately 11% of the Winter Storm vegetation related outages).
