

Cap and Trade Programs for Air Emissions

Presentation for
Louisiana Public Service Commission

Clean Air Markets Division
U.S. Environmental Protection Agency
Office of Air and Radiation
May 29, 2008

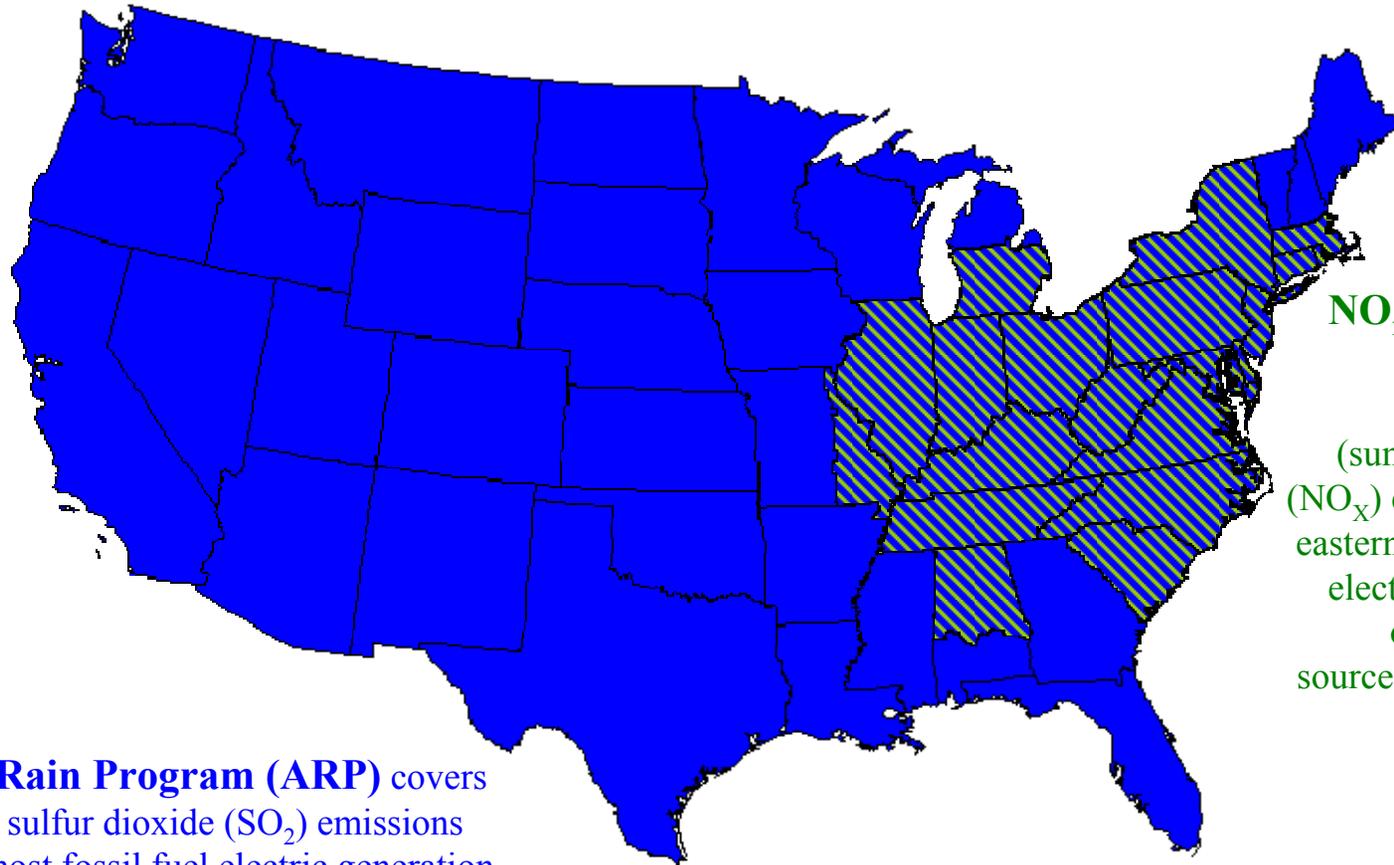

Overview

- What is cap and trade?
- Successful U.S. cap and trade programs
 - Acid Rain Program (ARP)
 - NO_x Budget Trading Program (NBP)
- Next generation cap and trade programs
 - Clean Air Interstate Rule (CAIR)
 - Clean Air Visibility Rule (CAVR)
- Why has cap and trade worked for U.S. emissions?
- Key lessons learned
- Emerging cap and trade issues for greenhouse gas programs

What Is Cap and Trade?

- “**Cap and trade**” is a program where the government:
 - Reduces air emissions by setting a mandatory **cap** on aggregate emissions below the existing pollutant levels, **and**
 - Provides covered sources **emission allowances equal to the cap that can be bought or sold (traded)**
 - Unused allowances can be “banked” (saved) from year to year
- The government distributes emission allowances either freely (allocation) or by sale (auction)
- Sources comply with the program by holding enough allowances to cover their emissions. Commonly starting with some allocated level of emission allowances, sources are able to:
 - Lower emissions and free up allowances to trade, bank, or sell
 - Continue emitting at levels higher than their allowance allocation and purchase allowances to cover their excess
- In “**the market**,” parties find each other: those with the lowest cost of reducing emissions generally sell allowances, and those with higher costs generally buy
- Because of the cap, the government does not need to define how or where emission reductions are made. **Government sets the goal** industry collectively must meet – the cap – and **monitors compliance**. **Industry** has the **responsibility** of determining **how to comply** and **gains significant flexibility** in compliance decisions

Successful Programs Emerged in the 1990s

Acid Rain Program (ARP) covers annual sulfur dioxide (SO₂) emissions from most fossil fuel electric generation units. Program implemented in two phases: 1995 for largest SO₂ emitters; 2000 for all others.

NO_x Budget Trading Program (NBP) covers ozone-season (summer) nitrogen oxide (NO_x) emissions in selected eastern states for fossil-fuel electricity generation and other large stationary sources. Program phased in from 2003 to 2007.

Programs rely on an emissions cap with air emission allowances that can be traded – cap and trade

Acid Rain Program for SO₂

Covers about 1,200 facilities with 3,500 units

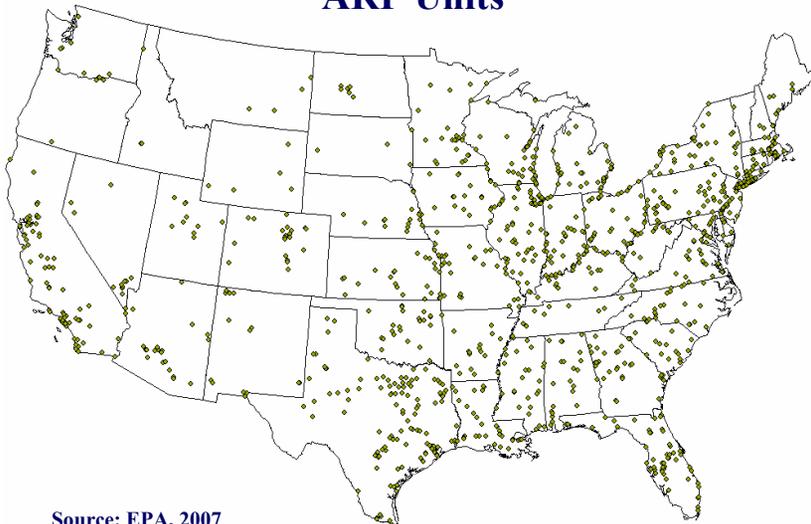

EPA has phased in the program:

1995: Most fossil fuel electric generation units >25 MW are monitoring emissions. 263 highest, SO₂-emitting, electric generation units have annual emissions cap

2000: Most fossil-fuel electric generation units >25 MW under annual emissions cap of ≈ 10 million tons that dropped to 9.5 million tons after that year

2010: New annual cap = 8.95 million tons

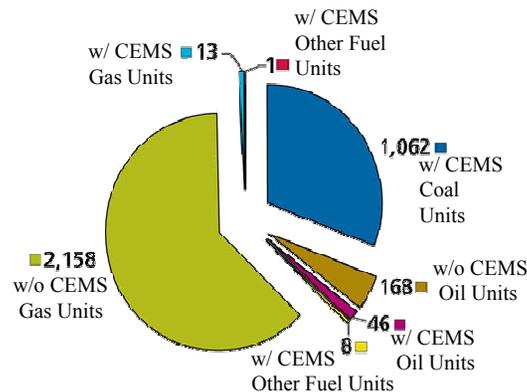

ARP Units

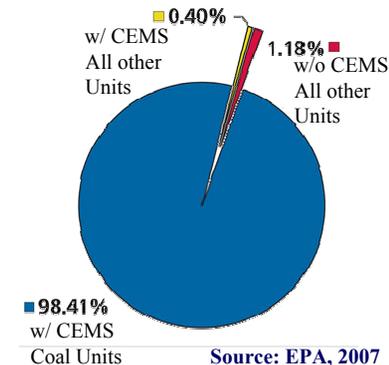

Source: EPA, 2007

- The vast majority of SO₂ emissions (98% in 2006) are from roughly 1,100 coal-fired units (≈420 power plants)
- All coal-fired units and some larger oil and gas units use Continuous Emission Monitor Systems (CEMS) subject to detailed operating and QA requirements
- Other units have monitoring that is less costly, but structured to assure emissions are conservatively estimated and audited

Number of Units Monitoring with and without CEMS

Monitoring with and without CEMS: Total SO₂ Mass Coverage

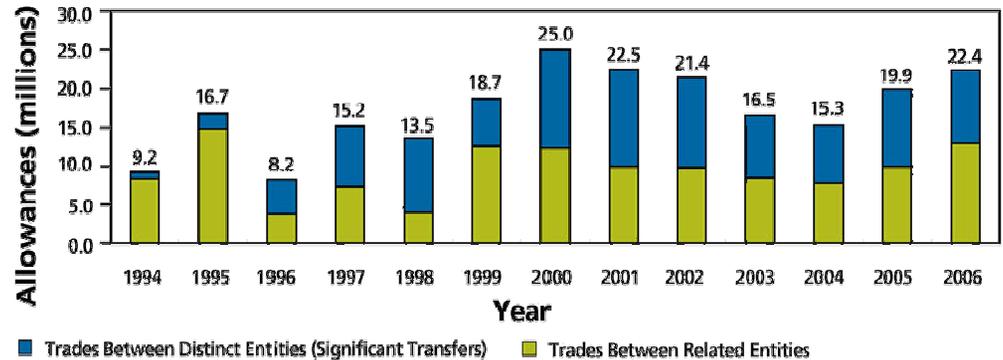

Source: EPA, 2007

- Quarterly emissions reporting and annual reconciliation of facility emissions and allowances – “true up”
- All data is publicly available. EPA reports progress annually
- “Virtual” 100 percent compliance

Acid Rain Program Trading and Banking

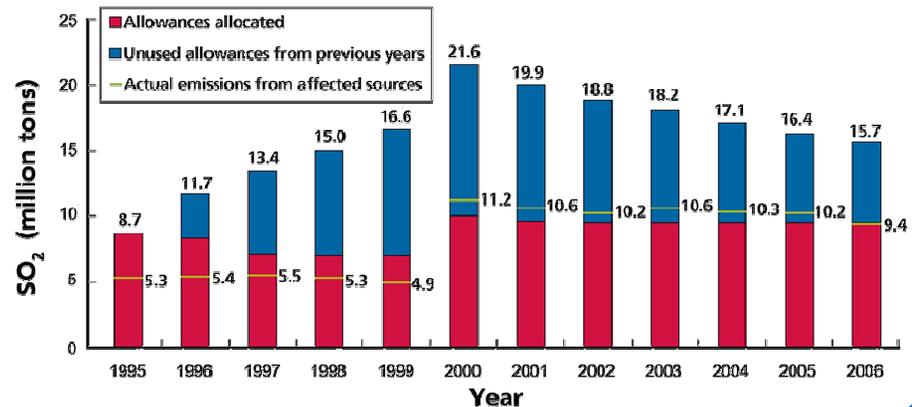

- One allowance covers 1 ton of SO₂
- EPA has allocated all SO₂ emission allowances to facilities and recorded them in electronic accounts
- EPA publishes allowance transfers daily. Anyone can buy or sell allowances
- Each year, EPA auctions 2.8 % of allowances which are taken from affected sources: proceeds are given to these sources
 - Started in 1993 to help with allowance price discovery in emerging market and to ensure new entrants had access to allowances
- Without restriction, all allowances are traded openly, and the market has matured over time
- Since the ARP's outset, there has been considerable "banking" of allowances
 - Provided substantial early environmental gains
 - Led to considerable compliance flexibility for power companies

SO₂ Allowances Transferred under the Acid Rain Program

Source: EPA, 2007

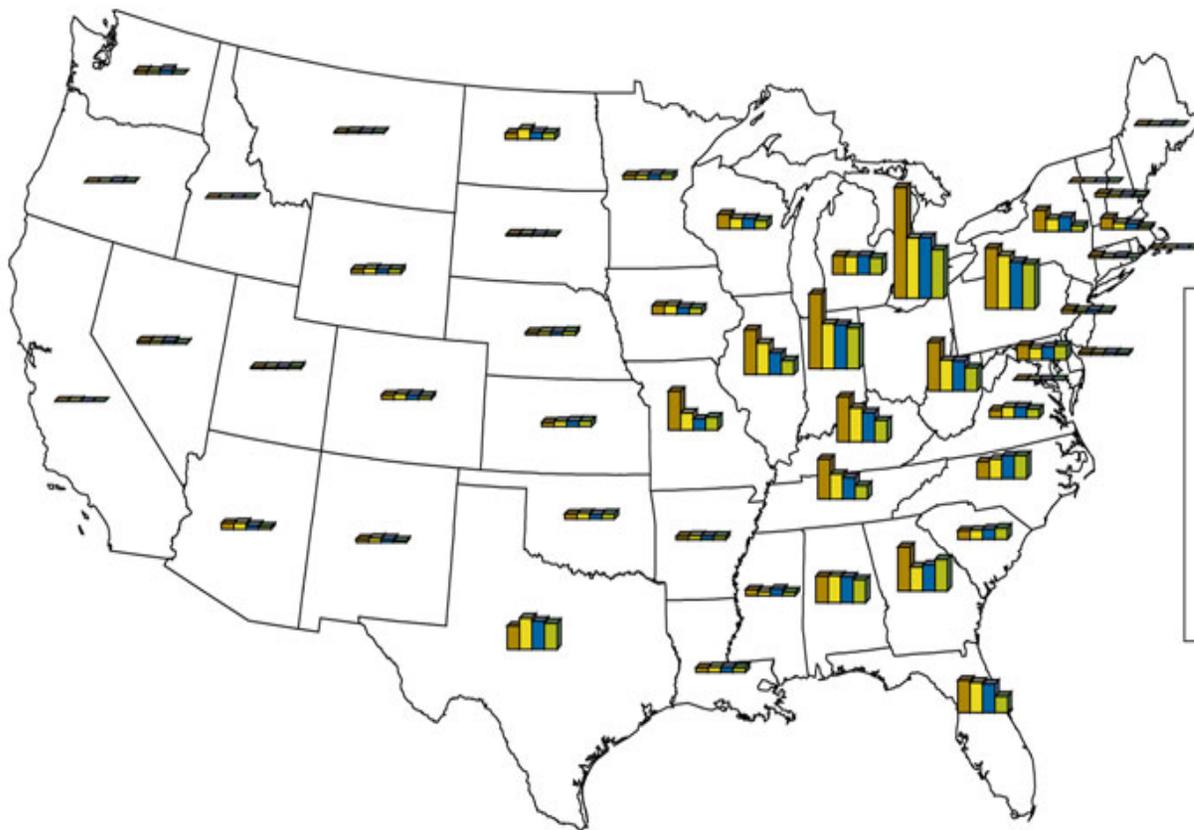

SO₂ Emissions from Acid Rain Sources

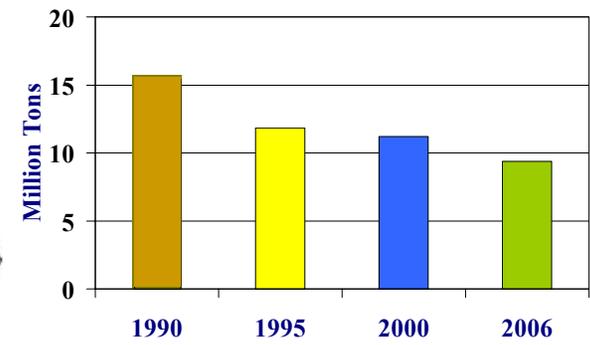

Source: EPA, 2007

SO₂ Emissions Have Fallen in Most States

State-by-state SO₂ Emission Levels from Acid Rain Program-affected Sources (1990-2006)

Acid Rain Emissions of SO₂

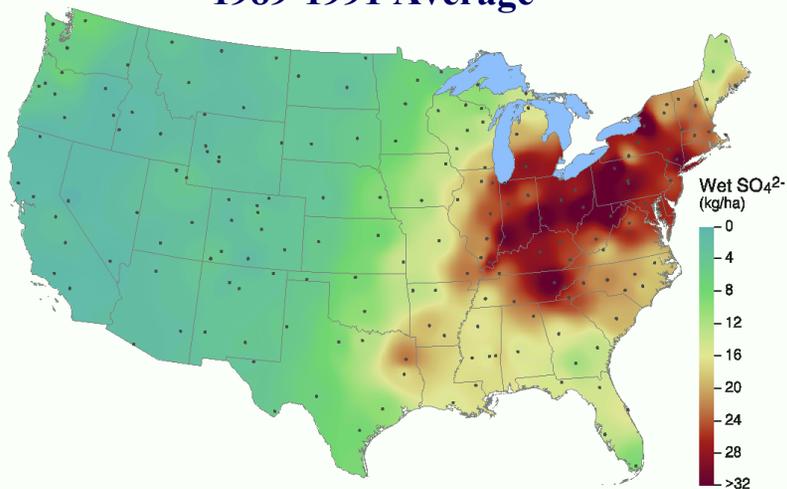

- SO₂ Emissions in 1990
- SO₂ Emissions in 1995
- SO₂ Emissions in 2000
- SO₂ Emissions in 2006

Scale: Largest bar equals 2.2 million tons of SO₂ emissions in Ohio, 1990

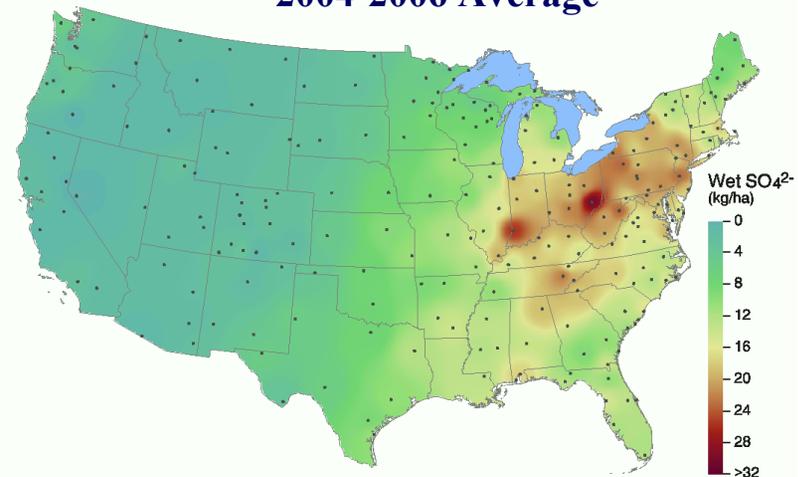

Acid Rain Program Progress

Annual Mean Wet Sulfate Deposition

1989-1991 Average

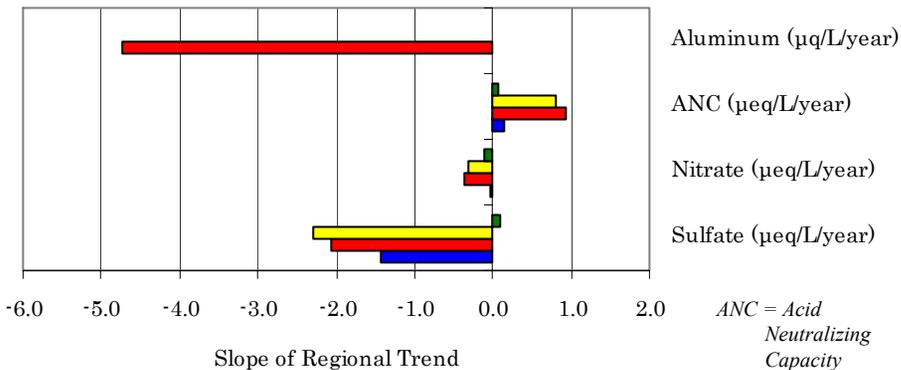

2004-2006 Average

Water Quality Improvements, 1990-2005

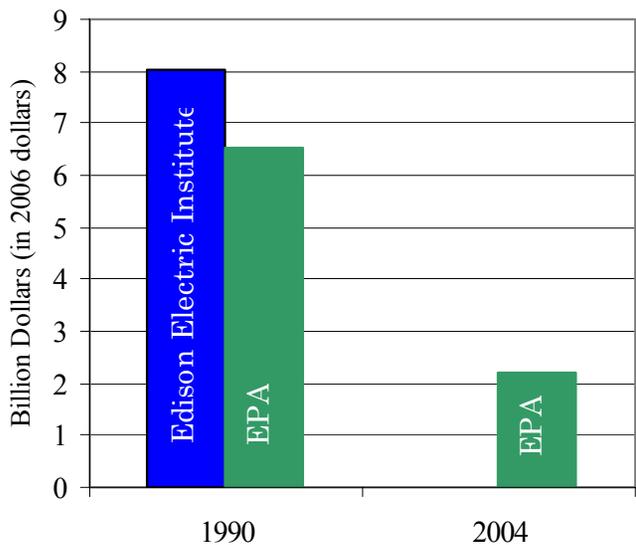

Source: EPA, 2007

Substantial Gains:

- Reduced “Acid Rain”
- Improved Air and Water Quality
- Improved Health (lives extended and ailments reduced)
- Reduced Regional Haze
- Provided Other Benefits

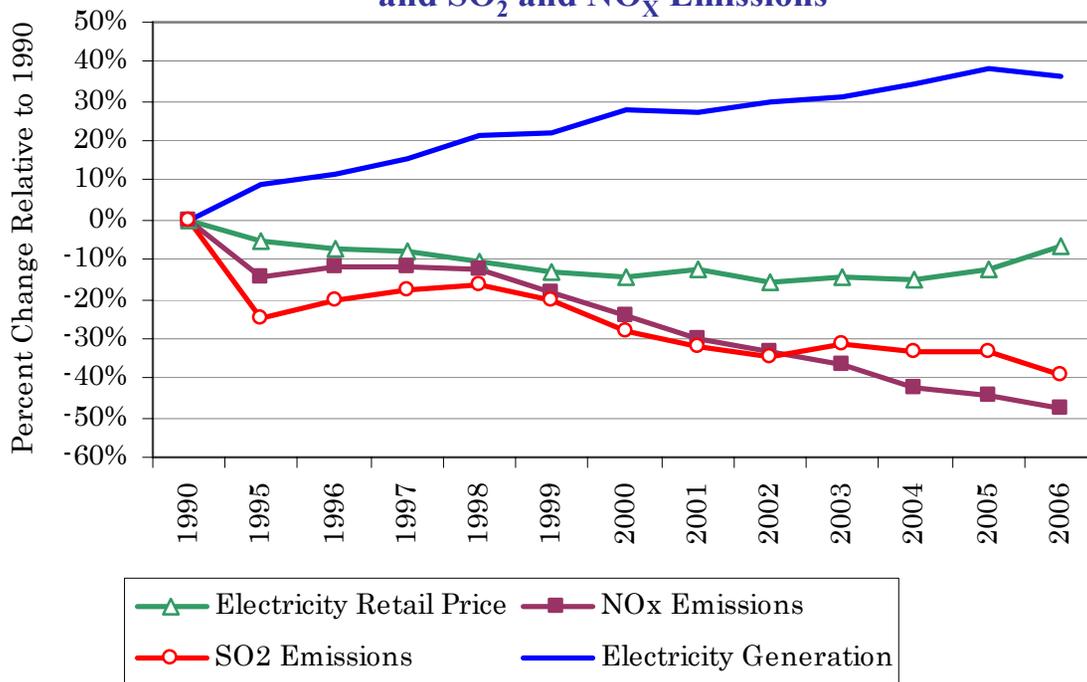

Control Costs: Lower than Predicted

Estimated SO₂ Program Costs in 2010

Source: EPA, 2007

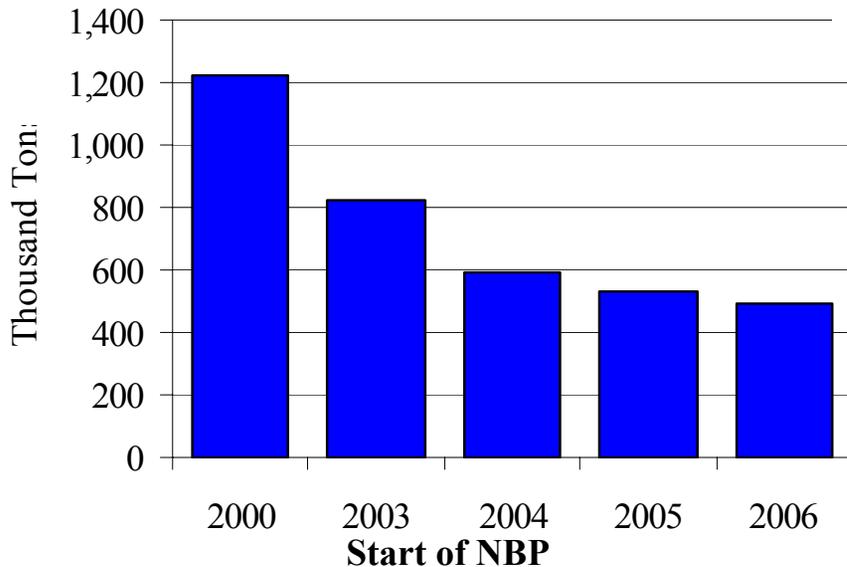

Trends in Electricity Generation, Electric Prices, and SO₂ and NO_x Emissions

Source: EPA, 2007

NBP Emissions Reductions

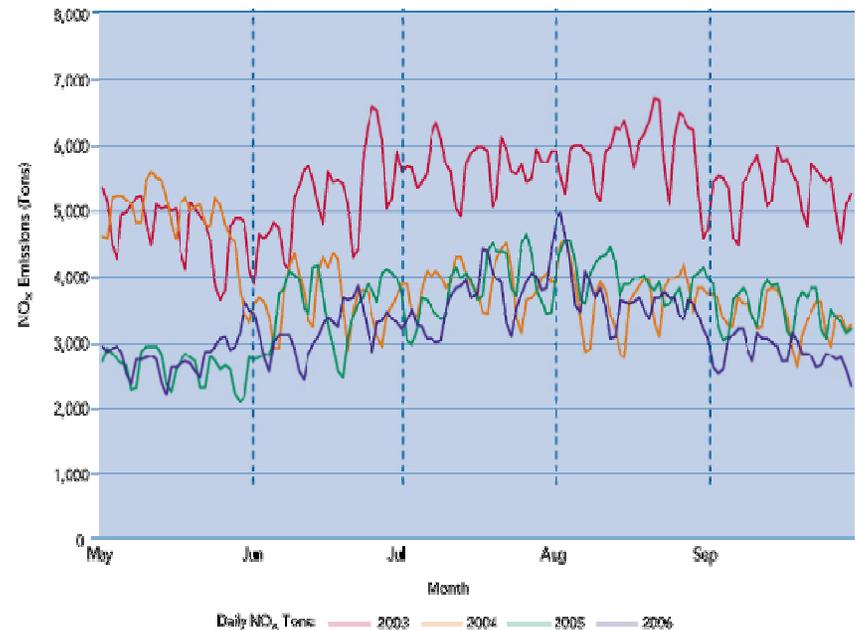

Ozone Season* NO_x Emissions 2000 to 2006

* Ozone season is from May 1 to September 30.

Source: EPA, 2007

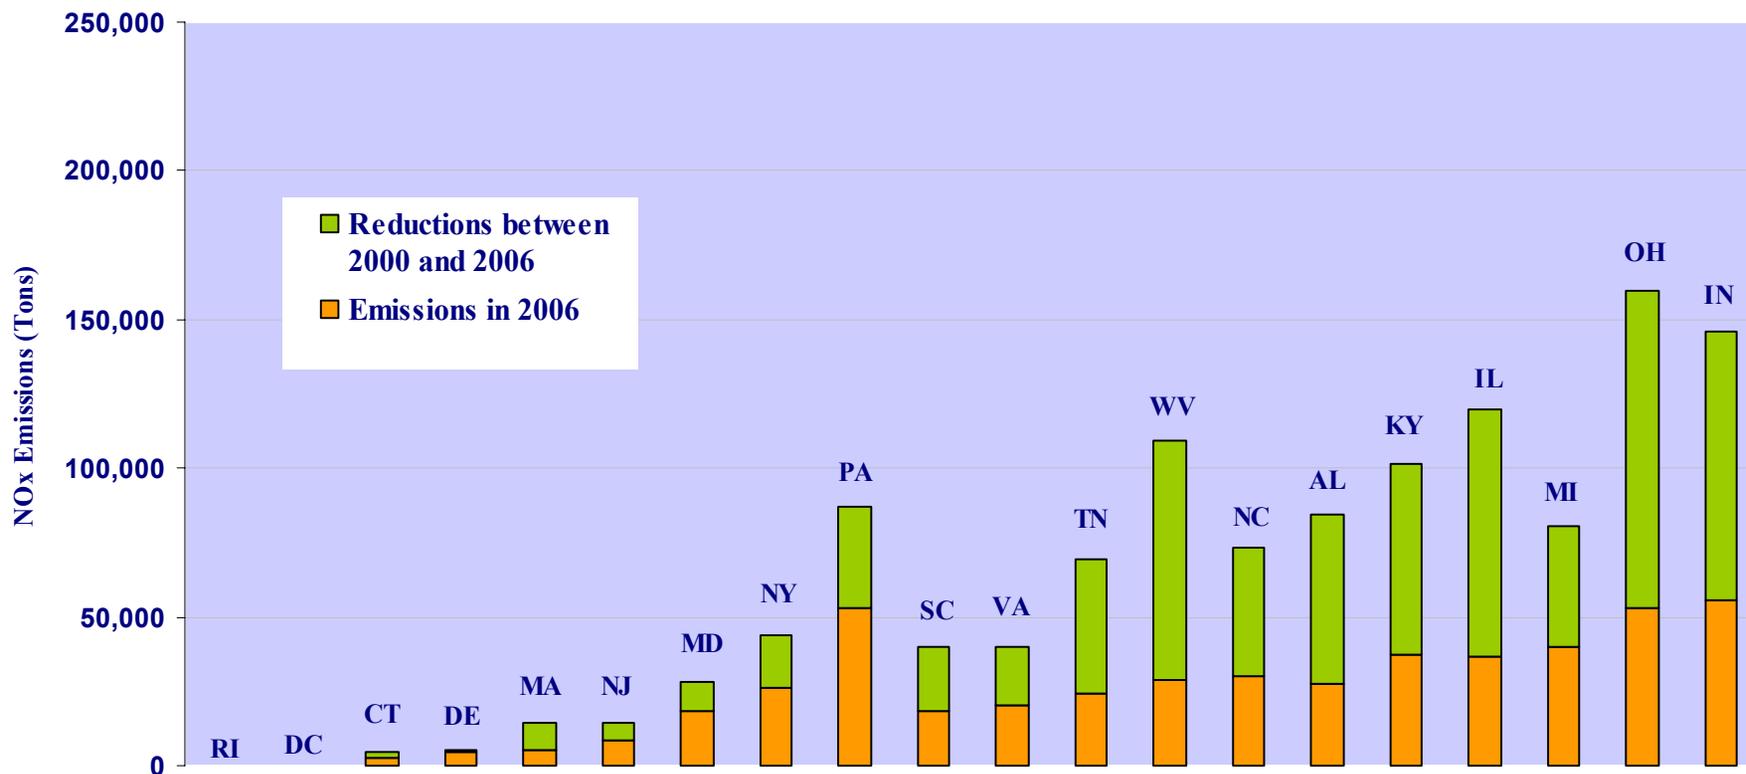

Comparison of Daily Ozone Season NO_x Emissions from NBP Sources, 2003-2006

Source: EPA, 2007

- Power plants and large industrial sources lowered ozone season NO_x emissions about 60 percent from 2000 levels

NBP State-by-State Ozone Season NO_x Emission Reductions from 2000 to 2006

- For each state, the total bar (i.e., the sum of the orange and green stacked bars) depicts emissions in 2000 and the orange bar depicts emissions in 2006.
- Results in Alabama and Michigan represent ozone season emissions from only the affected portion of each state.

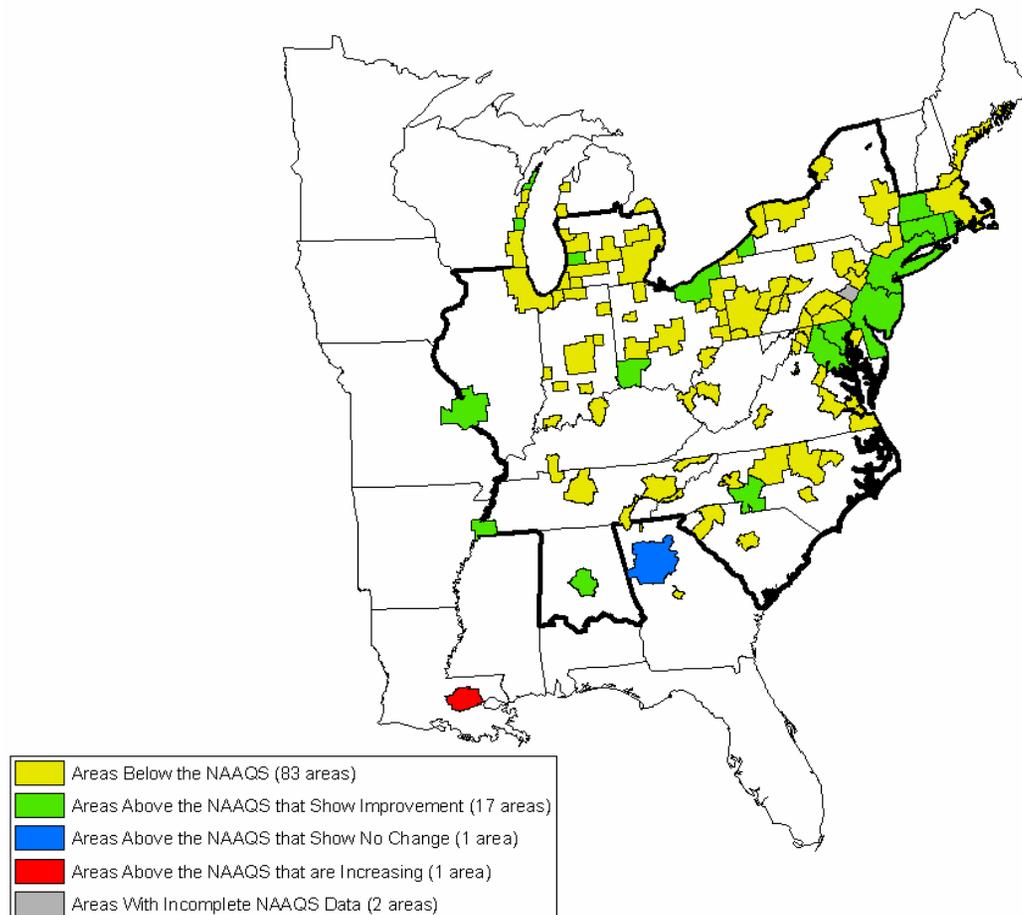

Source: EPA, 2007

Ozone Attainment Has Improved Dramatically

The NO_x Budget Trading Program is the most significant contributor (of EPA and state programs) to ozone improvements in the East

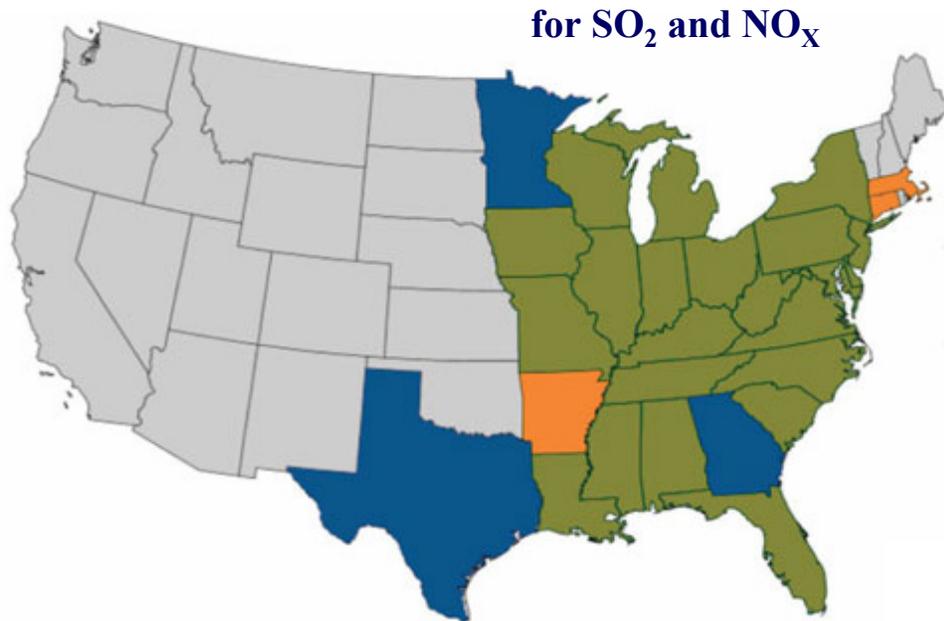

- In 2004, EPA designated 104 areas in the East as 8-hour ozone NAAQS nonattainment areas
- 2004-2006 data show ozone air quality improvements in virtually all of these areas, bringing cleaner air to over 55 million people
- In 2006, four out of five of the original nonattainment areas met the ozone standard

Changes in 8-Hour Ozone Nonattainment Areas in the East 2001-2003 (Original Designations) Versus 2004-2006

Next Generation Programs: Clean Air Interstate and Visibility Rules

States Covered in Clean Air Interstate Rule (CAIR) and Clean Air Visibility Rule (CAVR) for SO₂ and NO_x

CAIR Emission Caps* (million tons)

	2009/2010	2015
Annual SO ₂ (2010)	3.7	2.6
Annual NO _x (2009)	1.5	1.3
Seasonal NO _x (2009)	0.6	0.5

*for the affected regions

CAVR

Outside of CAIR Region – Best Available Retrofit Technology (BART) controls or States can create trading programs

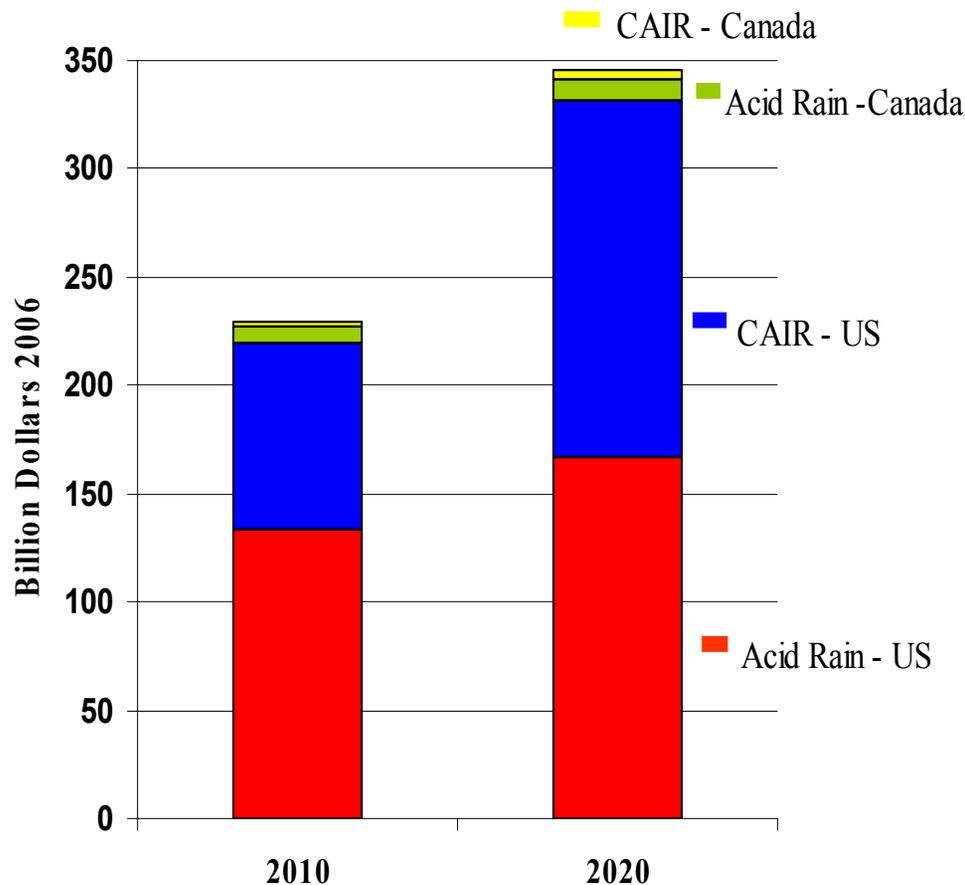

-  States not covered by CAIR, but covered by CAVR
-  States controlled for fine particles (annual SO₂ and NO_x)
-  States controlled for ozone (ozone season NO_x)
-  States controlled for both fine particles (annual SO₂ and NO_x) and ozone (ozone season NO_x)

Source: EPA, 2007

Note: On February 8, 2008, the U.S. Court of Appeals issued a decision vacating the Clean Air Mercury Rule (CAMR) and thereby suspending the program that allowed mercury emissions trading. On May 20, 2008, the Court denied the Department of Justice's request for a rehearing of the case.

Benefits of Acid Rain and CAIR Programs

Monetary Benefits

Source: EPA 2007 and 2008

- Majority of benefits result from:
 - Avoidance of premature deaths*
 - Reduced aggravation and incidence of heart and lung ailments
- Other benefits include increased worker productivity, reduced absences from school and work, and visibility improvement in some parks
- Benefits not included in estimates:
 - Acid rain environmental benefits
 - Mercury co-benefits
 - Remaining visibility benefits from parks and urban areas
 - Others

*EPA has estimated that the programs lead to the annual avoidance of about 32,000 and 42,000 premature deaths in 2010 and 2020, respectively.

Key Elements of Cap and Trade

- **Emissions Cap:** Establishes a fixed quantity of allowances for each compliance period (year, season, or other)
 - Cap is the mechanism to achieve and maintain the environmental goal
- **Coverage:** Determines which sources and/or sectors are included (existing and new)
 - Coverage should minimize shifting of production and emissions (“leakage”) that may reduce the environmental effectiveness of the program
 - Coverage should capture large share of emissions but be administratively manageable
- **Emission Monitoring, Reporting, and Verification:** Requires complete, accurate measurement and timely reporting of emissions to assure accountability and provide public access to data
 - Leads to program integrity and confidence
- **Allowance Distribution:** Provides initial allowances to regulated community and others (based on political decisions) through mechanisms such as government allocation and auctioning
- **Allowance Trading:** Allows companies to choose (and change) compliance options – leads to significant cost savings
- **Stringent, Automatic Penalties:** Ensures the environment is made whole and penalizes non-compliance
- **Assessment:** Determines program effectiveness and whether more actions needed

Allowance Distribution

- **Considerations:** Equity, incentives, certainty, efficiency, revenue impacts, price effects, profitability
 - Allowance allocation should balance the need for certainty and changing circumstances
- **Experience:** Generally allocation does not change the environmental outcome. (The emission caps and option for “banking” of allowances over time drive the environmental performance). Allowance allocation can substantially influence compliance expenses by individual firms and the total distributional effects of a program.
- **Approach:** Many options, none are perfect
 - Direct allocation to sources based on historical and/or current emissions, energy use (input), or production (output, e.g. electric generation), with the option of set-asides within the cap for certain sources and/or actions (new sources, renewables, demand side efficiency)
 - Auction
 - Hybrid
 - Auction phase-in following allocation

Monitoring, Reporting, and Verification

- **Considerations:** Equity, incentives, accuracy, timeliness, certainty, transparency, public perception, and confidence in program
- **Experience:** EPA collects high-quality SO₂, NO_x, and CO₂ data from about 3,500 emission sources in the Acid Rain Program
- **Approach:** Focus on complete and accurate emission data
 - Most accurate methods required of largest emitters with **flexibility** through alternative, less-costly measurement approaches for other emitters
 - Built-in **incentives** for greater accuracy and completeness
 - Standardized **quality assurance** tests for every emission value through standardized tests and statistical analyses
 - Petition process to accommodate unexpected situations
 - Heart of process is maintenance of CEMS on major emitters (all coal-fired units and others) that monitor emissions (at high reliability and accuracy levels) hourly and report to EPA every quarter

Some Details of Operations...

The screenshot shows the CAMD Business System web interface. At the top, there are navigation buttons: Home, File Submission, Interactive, Help, Glossary, and Logout. The main heading is "PRIVATE TRANSFER" with a sub-heading "Review/Submit Transfer". A text box contains instructions: "The information you have provided is listed below. You may update the starting or ending serial numbers or the total. If you selected the blank grid option, enter the program vintage year, starting serial number, and ending serial number or total for each block you wish to transfer. If it is correct, please click the SUBMIT button." Below this, the "Received Date" is 02/12/2008. There are two sections: "Transferor Account" and "Transferee Account". The Transferor Account details are: Account Number 99990000140, Account Name Cantor Fitzgerald Brokerage, and Representative Name Lauren Kisling. The Transferee Account details are: Account Number 000988FACTLY, Account Name Tanners Creek, and Representative Name John M McManus. A section titled "Allowances to be Transferred" includes a "Perpetuity Transfer" checkbox and a table with columns for Program, Year, Starting Number, Ending Number, and Total. The table contains two rows: one for ARP in 1997 with starting number 5135384 and ending number 5135387 (total 4), and one for ARP in 1999 with starting number 4505862 and ending number 4505862 (total 1). Below the table, it says "Total: 5". At the bottom, there are "Back" and "Submit" buttons. The footer of the page reads "4106-202 - D20U - Database: Quality (CAMD9) - Version: 3.7".

Received Date: 02/12/2008

Transferor Account

Account Number 99990000140
Account Name Cantor Fitzgerald Brokerage
Representative Name Lauren Kisling

Transferee Account

Account Number 000988FACTLY
Account Name Tanners Creek
Representative Name John M McManus

Allowances to be Transferred Perpetuity Transfer

Program	Year	Starting Number	Ending Number	Total
ARP	1997	5135384	5135387	4
ARP	1999	4505862	4505862	1

Total: 5

4106-202 - D20U - Database: Quality (CAMD9) - Version: 3.7

Allowance Accounting

- Official record of allowance transfers and holdings
- Each allowance has a serial number
- Parties reach agreement, then transfer allowances online, or authorize EPA to transfer allowances
- CAMD Business System is not a trading platform

E-government at work...

Reporting Results

- Annual reports on program results
- Public access to data and reports

<http://cfpub.epa.gov/gdm/>

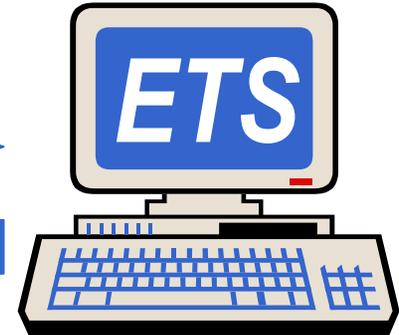

Electronic Reporting and Feedback

Source electronically submits emissions data every quarter

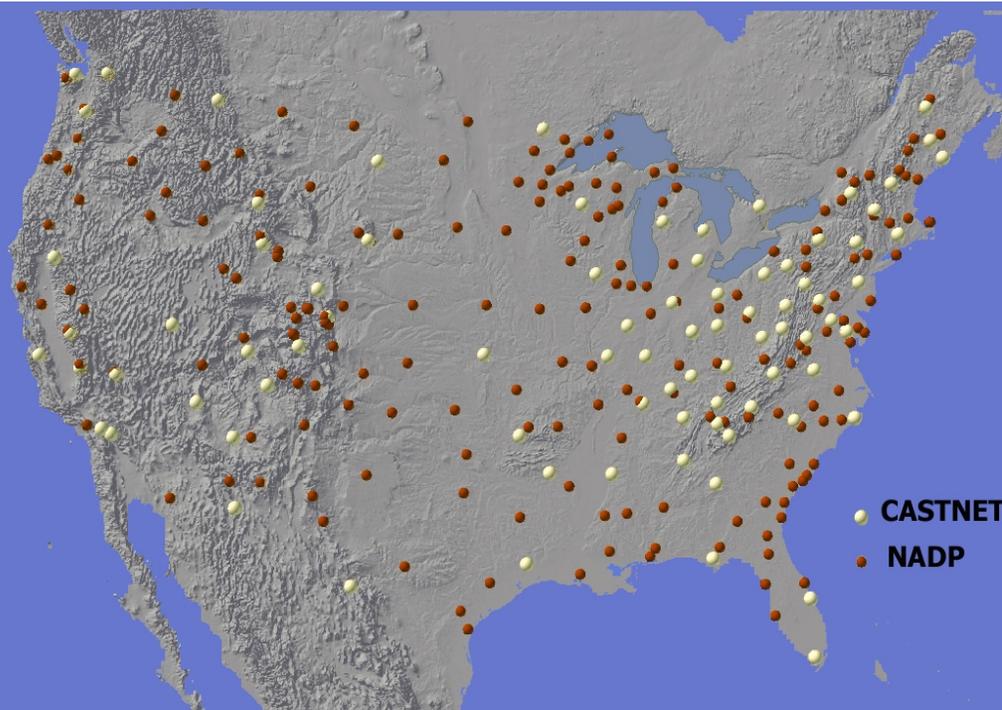

EPA checks data quality and provides automated feedback to source

	Reporting Period or Quarterly	Cumulative Annual or Cumulative Ozone Season	EPA Accepted
SO ₂	2633.4	5629.1	2633.4
CO ₂	230774.0	601228.0	230774.0
Heat Input	2249279.0	5013635.0	2249279.0
NO _x Rate	0.3	0.3	0.3

Assessment

- There are annual program assessments
- EPA considers results from multiple sources; an urban monitoring network and a rural network developed for ARP

Temporary Integrated Monitoring of Ecosystems/ Long Term Monitoring System (Surface Water Monitoring)

- Measure results through broad monitoring networks
 - *Changes to deposition, water quality, ambient air quality*
- Compare to program goals; assess need for further action

Advantages of Cap and Trade

- Offers alternative to traditional regulation and credit trading
 - *Not simply a trading feature added to existing regulation*
- Provides certainty that a specific emission level is achieved and maintained
- Leads to regulatory certainty, compliance flexibility, and lower permitting and transaction costs for emission sources
- Requires fewer administrative resources from industry and government (if program design is kept simple)
 - *Government can focus on setting goals & assuring results, not on approving individual compliance actions*
- Creates incentives for innovation and early reductions
- Operates compatibly with other mechanisms
- Makes greater improvements feasible through lower costs

Why Has Cap and Trade Worked?

- Cap on emissions
 - Ensures environmental goal
 - Provides predictability for allowance trading market
- Full-sector coverage of existing and new emission sources
 - Focuses on sources with heterogeneous compliance options and costs
 - Focuses on sources with capability to monitor and report emissions reliably and accurately
 - Limits ability to shift generation and emissions to non-covered sources
 - Eliminates need to conduct case-by-case review of emission reductions
- Complete and accurate emission measurement and reporting
 - Assures accountability and program credibility
 - Provides transparency and public access to data
- Limited restrictions on trading and banking complemented by source-specific limits where needed to protect local air quality
 - Allows companies to choose compliance options
 - Addresses “hotspots” through local requirements for direct controls, if necessary
 - Reduces costs

Key Lessons Learned

- Greatest reductions occurred where the highest emissions existed
- Trading provides regional emissions reductions, which can (and are) augmented with local direct controls
- Caps protect the environment, not the allowance allocation
- “Banking” leads to early emission reductions that provide early benefits and flexibility for sources to contain and lower compliance costs
- Implementation should be kept in mind when designing programs
 - Setting the goal
 - Verifying emission data
 - Administering and enforcing the program
 - Helping affected sources understand their options and obligations
- Good legislation makes the job much easier
- Virtually 100% compliance can result
- Start and pace of control matters, especially to gain cost advantages

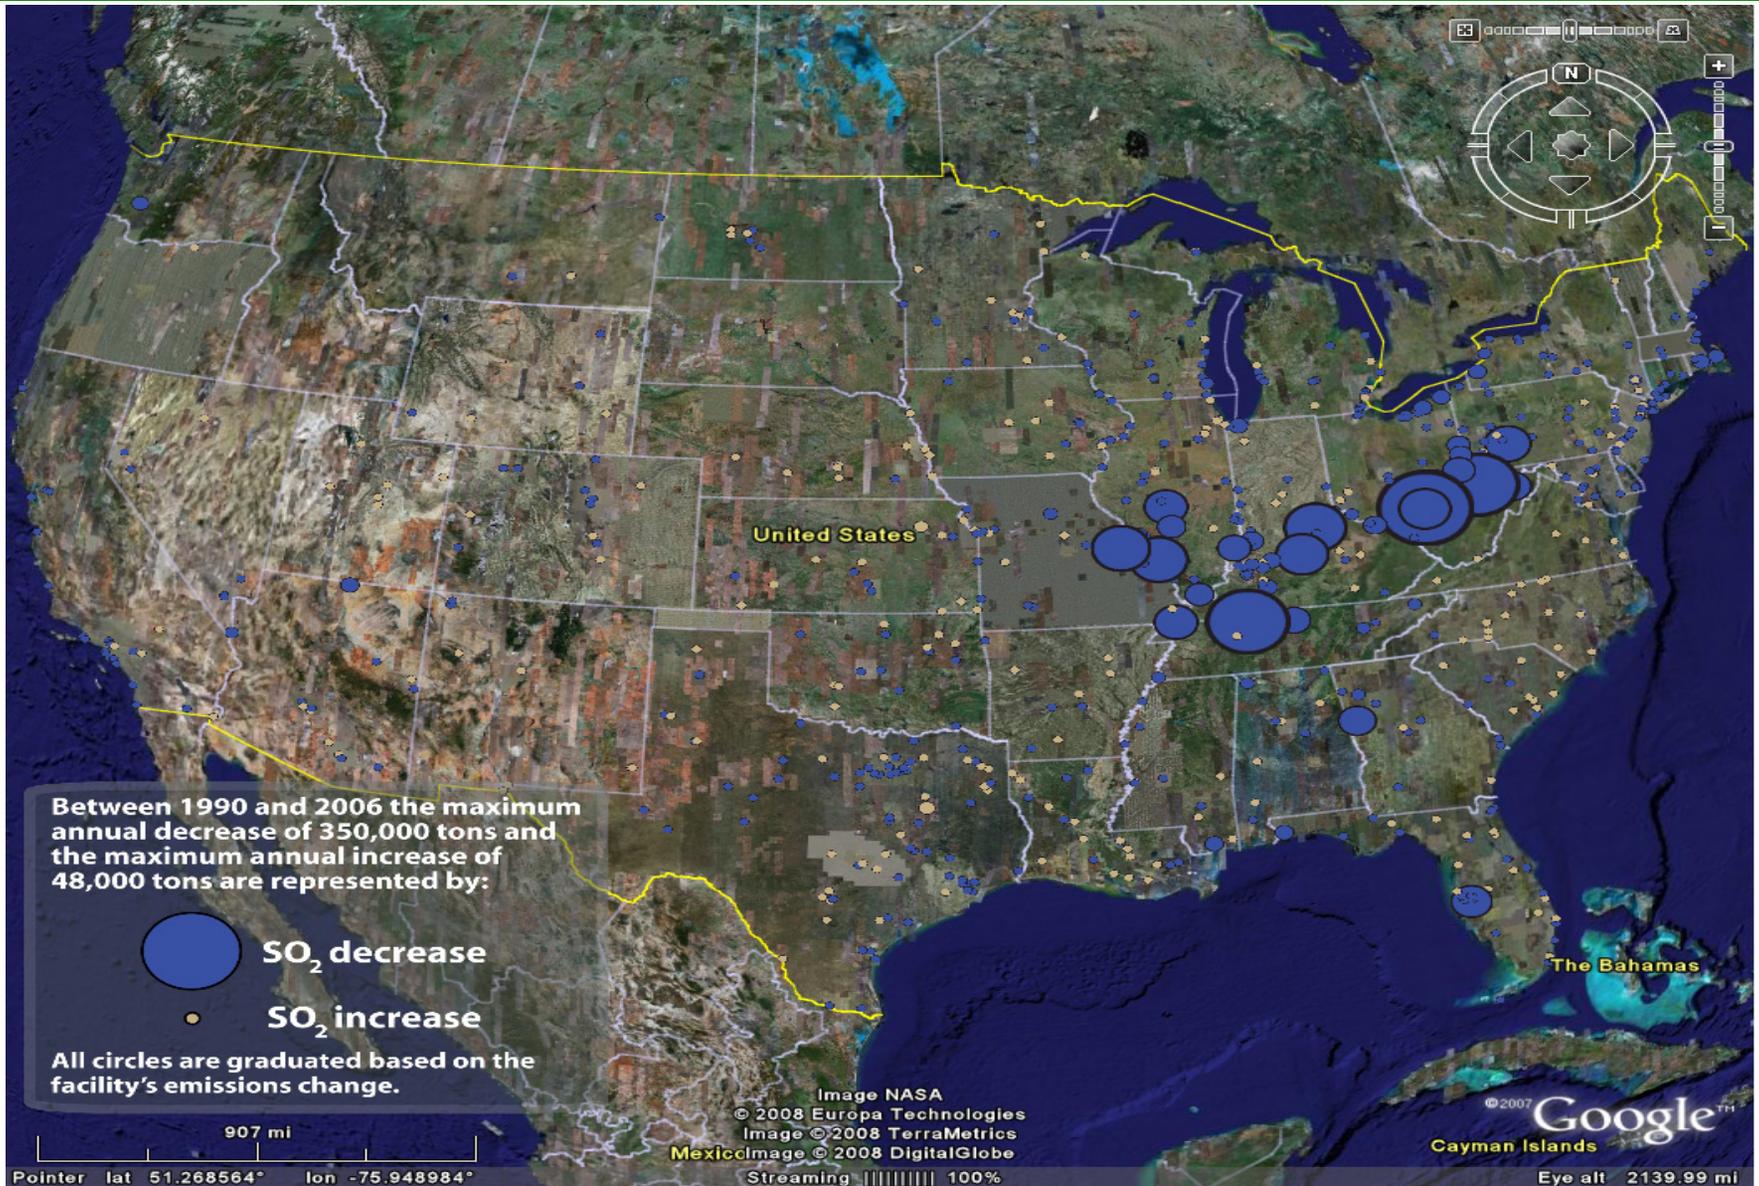

Key Lessons Learned *continued*

- Accountability and transparency essential to program integrity
 - Requires accurate, complete emissions measurement
 - Provides transparent emission and allowance data
 - Creates predictable and, preferably, automatic consequences for noncompliance
- Simple and effective design and operation focused on key objectives reduces administrative burden and costs, and improves compliance and timeliness
 - Establishes a minimal, but effective role for government
 - Provides industry compliance flexibility with accountability – this unleashes incentives for better, cost-effective controls
 - Facilitates market development to maximize flexibility and cost savings
 - Ensures environmental results through clear objectives, strong monitoring and predictable penalties
 - Requires a relatively small number of government staff to produce results (especially when advanced information management technology is used)

Key Lessons Learned *continued*

- Accurate baseline emissions inventory critical to effective design
- Valuable to have a program structure that is readily adaptable
- Advanced computers, software, and the internet allow a transparent, “user friendly” set of large data management systems to support the program’s objectives
- Cap and trade can work outside of the power sector
- Assessment routinely enables programs to stay environmentally on track
- Industry having the responsibility to determine how to comply under a flexible program that has clear pollution reduction goals laid out in the air emissions caps unleashes innovation and leads to lower compliance costs

A Better Look at a Lesson Learned: The Biggest Emitters Achieved the Steepest Annual Reductions

Emerging Issues for GHG Programs

- Levels and timing of control
 - Cost containment
- Scope and scale
- Point of regulation
- Federal and state roles
- Technology development and deployment
- Distribution of allowances
- Equity
- Linkage to cheaper GHG tons
 - Energy efficiency
 - International programs
 - International and domestic offsets
- Cap and trade vs. tax
